

The quest to save our world from mass destruction!

What caused this problem?

The impact on the Earth is awful. If you didn't know, the human population has almost tripled over the past 80 years! Humans have caused many fatal disasters, which include: global warming - Deforestation and loss of land mass. We must act as soon as possible so that we aren't too late. Our wilderness is dying quicker than you can imagine; It has gone down from 66% to as little as 35% in the past few decades. Is it too late to act?

What has caused the problem?

Forests cover over 30% of the earth. Without trees, humans wouldn't be able to breathe as carbon dioxide would take over the atmosphere. Within a century all rainforests will disappear. Most animals would be extinct by then as a result of deforestation. These animals include; Asian elephants, mountain gorillas, orang-utans and vaquitas will go extinct by 2035. If you like animals, you might not want to know that only 23% of animals are left and 20-40% of plants are still here. Deforestation needs to go and we need to encourage the government for it.

My solution:

It is obvious that we need to have more education about this matter as a response to this devastating situation. The better educated people are about this, the more we realize how important nature is to humans and the benefits it gives us. If we are able to follow in the footsteps of Costa Rica, then the whole planet could be saved, WE need to change our way of living and adapt to our surroundings.
