

Mission Apolo: Saving our planet

Ever since human beings inhabited the Earth, the damage that has been done to the planet is more than the mind can imagine. Our population has increased in the past 80 years, that's eight decades! In the 90's our population was estimated to be around 5 billion, now it's about 8 billion! That means in the last couple of years our population has increased by 3 billion. That means that more than 1 million babies are born each year. So now humans are located all around the earth, leaving every area damaged or tainted. Half of the world's wilderness has been reduced from 66% to 35%. As more trees are cut down, the amount carbon in the atmosphere has been increased. Us human's must act before it is too late to save our planet. What sacrifices must be made and how long until our magnificent planet is reduced to a lifeless wasteland?

The problem:

As human beings continue to overpopulate the Earth, the population of wild animals continues to decrease. You may be thinking, how on earth are animals decreasing if there is no sickness or problem? and the answer to that is quite simple, us human beings are the problem! Think about it, us humans continue to chop down trees, pollute our oceans and hunt animals. So if action is not taken our whole animal and vegetable supply will be extinct and sooner or later us human beings will be extinct as well.

How to save the planet:

So after reading the second part of this documentary, you may think Earth as we know it is gone and there is nothing we can do to save it. Wrong! Take Costa Rica for example, they cut down their rainforests but soon replanted them as they realised how important they are. You can do something to save our planet before deforestation can do any more damage. By replanting trees, reducing meat consumption, recycling and buying eco-friendly products, you can slowly and surely help put a stop to deforestation. You can also go on a walk instead of using a car and also, change your diet! Stop destroying cows' habitats just because you want a bite of a Mcdonald's burger.

We must stop deforestation, fast fashion and single plastic before our oceans and animal habitats are gone forever. Let's help save the world and make a better place for the next generation.

One change can make a big difference to the world.
