

The last chance to save our planet

The impact humans have had on this Earth is unbelievable. The population over the last 80 years has more than tripled which surprisingly is more than 8 billion. Humans now live all around the globe and are brutally cutting more trees down to make room for more life.

There is a problem because of many things but one of the main ones is overpopulation. One that has a very big impact is burning fossil fuels. Deforestation is causing animals and plants to become extinct. Also polluting water with sewage causes fish and corals to be damaged.

It couldn't be more clear that we need to act and make our response to this devastating situation. We must use Costa Rica as our example and think how the change can be for the good. We need to join the science side and make a change on how we live, becoming less dependent on resources such as clothing, food, travel and energy. We MUST challenge our government and family and friends to put the environment first. History shows us that we can make a change together and we have to do it together. Act now otherwise it will be too late!
